Let it Snow Desktop 2.0 brings the real weather to your Mac desktop

Free update adds Live Weather, a new design and support for any number of displays

Let it Snow Desktop is a free and lightweight macOS app that adds a realistic snowfall to the desktop wallpaper, behind every window. Version 2.0 is the biggest update since launch.

The headline feature is **Live Weather**. Tie a display to any city, or to your current location, and the snow follows its hourly forecast from Apple Weather: how much falls, from flurries to a blizzard, speed and sway from the wind, flake size from the temperature, rain and sleet when it rains there, and a clear desktop under clear skies. Live Weather is free, and your location is optional.

Version 2.0 also brings:

- A new design with smooth, soft animation throughout, and Liquid Glass controls on macOS 26
- Four particle styles: Crystal, Glow, Rain and Mixed, which combines any two
- Any number of displays, each with its own settings, restored exactly when a display reconnects
- Every known bug and annoying glitch fixed

The app stays as light as before. With snow on two displays it uses up to **1% CPU** and up to **80 MB of RAM**, with a **Low Energy Impact** in Activity Monitor. It runs natively on **Apple Silicon and Intel**, works at the screen's refresh rate, and has no ads and no tracking.

In the first two days after its original release, Let it Snow Desktop reached the **Top-10 in its category in Ukraine** and the **Top-25 in the United States** in Entertainment. It has since been covered by MacMenuBar, Softpedia, AlternativeTo, Spider-Mac and others.

Let it Snow Desktop 2.0 requires macOS 13.5 or later and is available in 10 languages.
